

Borealis, Thinking Circular to Close the Loop.

Borealis has made the Circular Economy of polyolefins a key focus area in its sustainability and company strategy and is committed to lead the transition to a circular economy in our industry, offering the full spectrum of solutions: from design for recyclability, design for reuse, advanced mechanical recycling and chemical recycling to close the loop completely.

Since 7 years, it is offering mechanical recycled PP and PE to the market and it is since extending its portfolio with other technologies to use plastic waste or renewable feedstock as alternative feedstock to produce its products.

Borealis is developing its Borcycle™ technology: an evolving suite of recycling technologies and partnerships. Borcycle™ C represent our portfolio of chemical recycled grades and forms a key part of the puzzle to make all types of applications with recycled content and to close the loop for high demanding applications, including direct food contact, across all industries.

In recent years, Borealis made big steps forward in technology development and partnerships to accelerate the offering of its Borcycle™ C portfolio to the market.
